

Joomla!

Any person who uses a content management system knows the importance of having a great security system to ensure that all of your information is safe. If your information is lost or stolen by hackers, this can spell disaster for you and for any of your customers. This is why so much emphasis is put on security these days, especially with so many credit card number stored in websites databases. If these were lost, somebody would have no problem to instantly assume your identity and cost you a fortune. For a majority of the internet world, Joomla is their preferred method for managing their content. So, we are going to be talking about how to bulletproof your Joomla website.

The first thing that you should do when attempting to secure your Joomla website is to go through the Joomla administrator checklist. This might seem simple to some people but other people might skip right over this step. Although you may not always read the instructions to a product, this checklist can provide you some great tips to make sure that you have no unsafe information. It can also instruct you on how to better protect the areas of your site that are most vulnerable to hackers. Another good thing to do would be to look for some security based plug-ins. Plug-ins are a great way to add anything to Joomla that it doesn't initially come with when installed. There is literally hundreds of plug-ins out there just waiting to help your website become more secure. Yet another good precaution to take is to make sure that your password is secure enough to deter hackers. You should take your passwords seriously and take every precaution in making them as difficult as possible to crack. You should also try to change your password regularly. It's up to you for how long you want to wait in between passwords changes but about 3 months should be enough to keep the hackers off your tail. Any of these ways are a great way to start in how to bulletproof your Joomla website.

The last and most important thing you should do is stay up to date with the newest version of Joomla. Joomla releases updates every so often and offer them through their website. These updates often address and fix issues that occurred in older versions. If you don't upgrade you could leave your website vulnerable to hackers that have figured a way around the older versions. The newer versions will have fixed these problems and often offer improved performance for your website. It's simply just foolish for you not to keep up to date with the new versions that are released; after all, they do it for your benefit.

If you make sure to follow these simple steps, you can easily and immediately increase the security of your Joomla website. People often wonder how to bulletproof their Joomla website and the truth is, it's not that difficult. Just a few simple changes can have your content management system looking like Fort Knox.
